#### Program Summary:

A variation on the Dijkstra's algorithm. The algorithm checks if there is a node with the cost that equals to the first digit of your student ID. If there is no match, the algorithm follows the rule of the original Dijkstra algorithm to pick the node with the minimum cost.

- Source node is set to A
- First digit of student ID is set to 1

#### Instructions:

command line input

```
$ g++ -g -Wall 1623988288lab2.cpp -o 1623988288lab2  
$ ./1623988288lab2
```

#### About the code:

You can change the constant variable ID\_FIRSTDIGIT for the first digit of the student ID.
